

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Claim 1 (Currently Amended): A method for classifying information available on a computer network, the method including:

receiving a list of network resource locators, said list being created by identifying network resources accessed by users of the network;

for each network resource locator of the created list,

sending the network resource locator to a ~~graphic~~ graphical user interface (GUI) component of a at least one Web-coding workstation;

receiving a selection from the at least one Web-coding workstation, each selection representing a classification for the resource identified by the sent network resource locator, said selection being generated in response to a user using tools of said GUI component; and

storing the classification in a database in relation to said resource locator.

Claim 2 (Currently Amended): The method of claim 1, wherein the list of network resource locators includes one or more Web sites accessed by users of the network.

Claim 3 (Previously Presented): The method of claim 1, wherein said tools include a hierarchical taxonomy of classifications and said selection represents one of said classifications.

Claim 7 (Previously Presented): The method of claim 1, wherein the database is one or more from a group consisting of:

a flat file;

a binary tree;

a relational database; and

an object-oriented database.

Claim 8 (Currently Amended): A system for classifying information available on a computer network, the system including:

a resource generator component that creates a list of network resource locators from network resources accessed by users of the network;

a datastore component for storing classification information for a plurality of network resource locators;

a at least one graphical user interface (GUI) component having tools to allow a at least one user to select a classification for each resource respectively identified by the resource locators of said list; and

a classification processor component that receives the list of network resource locators from the resource generator component, causes presentation of said network resource locators using said GUI component, and receives the classification determined for each resource respectively identified by the network resource locators, and stores the classification in said data store component.

Claims 9-10 (Cancelled)

Claim 11 (Previously Presented): The system of claim 8, wherein said tools include a hierarchical taxonomy of classifications from which the user selects the determined classification.

Claim 15 (New) The method of claim 1, wherein the network resource locator is sent to more than one Web-coding workstation, and wherein said classification is assigned based on receiving more than one source selection from said more than one Web-coding workstation.

Claim 16 (New) The method of claim 1, wherein said list is sorted based on the number of unique users having access to a resource identified by the network resource locator.

Claim 17 (New) The method of claim 1, wherein the network resource locator is sent to a plurality of Web-coding workstations with each one of the plurality of Web-coding workstations being assigned a predetermined level from lowest to highest, and wherein said classification is assigned based on receiving a first predetermined number of same selections from Web-coding workstations at the lowest level, and if the first predetermined number of same selections is not received at the lowest level, basing the classification on receiving a second predetermined

number of same selections from Web-coding workstations at the next highest level, and if not received at the next highest level, repeating the process upward by level until a level specific predetermined number of selections are received from one of the levels.

Claim 18 (New) The method of claim 17, wherein the voting system is a multiple-level voting system including a first level, a second level, and a third level, and wherein a classification is assigned to a network resource locator upon receipt of at least three out of four first level votes, two out of three second level votes, or one third level vote.

Claim 19 (New) The system of claim 11, wherein said at least one graphical user interface (GUI) comprises at least one GUI, and said data store is connected for storing the classification therein based on more than one same classification received for each resource identified.

Claim 20 (New) The system of claim 11, wherein the classification processor uses a multiple-level voting system.

Claim 21 (New) The system of claim 20, wherein the multiple-level voting system includes a first level, a second level, and a third level, and wherein a classification is assigned to a network resource locator upon receipt of at least three out of four first level votes, two out of three second level votes, or one third level vote.

Claim 22 (New) The method of claim 8, wherein said list is sorted based on the number of unique users having accessed a resource identified by the network resource locator.
